History of changes in response to vulnerabilities.

Up to date as of 11/23/2026

On this page, we will compile information regarding security vulnerabilities detected in the system. Each problem listed in this table will have a CVE/CWE identifier or short description (if the vulnerability occurred in a specific part of the system), severity rating, status indicator, and the version where the issue was resolved. Vulnerabilities are listed chronologically, with the newest at the top of the list.

CVE / CWE	Detection date	Severity	Status	Versions with the fix
A SQL Injection vulnerability was identified in the application within the parameters of business rules invoked from form rules. The lack of proper input validation and parameterization allowed an attacker to manipulate the logic of the executed database queries.	2025-12-18	High	Resolved	2025.2.1.289 2026.2.1.62
An Insecure Direct Object Reference (IDOR) vulnerability was identified, allowing access to and execution of business rules based on object identifiers supplied by the user without proper authorization checks. This mechanism enabled unauthorized access to data and operations that should not be available to the affected account.	2025-12-18	Medium	Resolved	2026.1.4.125 2026.1.3.107 2025.2.1.289 2026.2.1.62
A Cross-Site Scripting (XSS) vulnerability was identified that allowed the injection of malicious JavaScript code, which could then be executed in the user? s browser. The vulnerability was present in the mobile application launch functionality.	2025-12-18	Medium	Resolved	2026.1.4.125 2025.2.1.293 2024.1.1.319 2026.1.3.109 2026.2.1.62
