1. Before upgrading WEBCON BPS

1.1. Before upgrading WEBCON BPS

- To avoid unnecessary interruptions in the system operation, make sure that WEBCON BPS licenses are up to date. To do this, verify the availability of the **WEBCON BPS Server 2021** license in the license report. This report is available from **WEBCON BPS Designer Studio** -> **system menu in the upper left corner** -> **Licenses**. Current licenses must be downloaded if necessary.
- If the changelog contains a section titled "Changes to existing features", please verify whether the changes will impact your implemented system in any way.

2. Bug fixes

2.1. Portal

- The order of columns in the Excel file exported from a **Dictionary Report** will correspond to the column order on the view from which the export was initiated.

2.2. Form

- Enhanced filtering with date values. It is now possible to filter using several date values selected from the heading filter menu of a column in the **Show Workflow Elements** WebPart.
- Fixed an error appearing on the Classic form when one of the **Item list** columns was a **Floating-point number** with a suffix configured as the value of another column of that Item list. In addition, an error was recorded in the event log for forms with several Item lists, but this error did not adversely affect the form.
- Fixed an issue with **Item list** columns of the **Date and time** type that were set as required using a **Form rule**. The red dot indicating that they are required will appear next to all relevant cells.

2.3. Designer Studio

- Fixed an issue that precluded entering text from an OCR document into a choice field in the **Popup search window** mode after enabling the **Allow adding values not in data source** option.

2.4. Actions

- Optimized the document archiving time by restoring indexes in the database.
- Exchange actions configured to set the status in Graph when creating/modifying Exchange Events will now work correctly.
- Fixed an issue that occurred when the **Generate an Excel file** action was configured to create an .xlsx file **From url**. In that case, the user received a message that the indicated file does not exist. After the change, with that configuration, Excel files are correctly generated.
- Adding privileges to a SharePoint list element via the **Add SP privileges** action will add privileges to the selected element only - an error caused the privileges to be added for the entire list.

2.5. Data sources

- Fixed a migration issue with the XML configuration of the **Data table** type form field. The issue occurred for data source columns whose names consisted only of spaces.

- Fixed an issue that made it impossible to filter the **SharePoint list** data source column using the value from the **Yes/No choice** form field.

2.6. Add-In

- Improved the operation of the Outlook Add-in from the e-mail message level when selecting a new task.
- Improved the loading of translations into the Outlook Classic Add-in.
- Fixed an issue with the Outlook Add-in that occurred directly after updating the add-in version.

2.7. Service

- Fixed the error "Site collection for this environment has not been set" appearing in Standalone installation. The error occurred during validation of the choice field whose data source was of **BPS users** type, and there was a path transition implemented by the service, for example, via an action triggered **On timeout**, **Cyclical action**, **Hotfolder**, **Hotmailbox**.
