AI Proxy Online

2026.2.256.61.

history of changes for version 2026.2.256.61.

1. New features

- Added a step-by-step generation flow to AI Process Builder in API v5, with separate endpoints for creating a session, running an individual tool, and generating a comment. This allows the client to display progress and retry a single step. The previous endpoint remains available and is now marked as legacy.
- Added support for Item list form field in AI Process Builder, including columns, column types, and validation.
- Added support for the form field matrix in AI Process Builder, including item list columns and column permissions.
- Added deterministic parsing of BPMN diagrams in AI Process Builder. The process structure is read without using the model, while the model is responsible for merging and naming steps.
- The AI Agent can now use data from static files attached to the process.
- Added file descriptions and categories to the attachment context passed to the model.
- Added a Helm chart for running AI Proxy Self-hosted in Kubernetes clusters, including k3s and AKS.

2. Improvements

- AI Proxy Self-hosted now supports JWT authentication using `ClientId/ClientSecret` as an alternative to mTLS, as well as separate certificates for each role (HTTPS, mTLS, JWT).
- The Helm chart now supports:
 - switching between mTLS and JWT,
 - separate certificates for each role,
 - secrets supplied through Kubernetes Secrets instead of being entered directly in the configuration,
 - HTTPS-only communication,
 - value validation before deployment.

3. Bug fixes

- Fixed errors in AI Agent and AI Concierge when using Azure AI Foundry models (HTTP 404 "Response not found").
- Fixed BPMN conversion:
 - gateways involving human decisions were converted into separate steps instead of paths,
 - return paths to merged steps were lost.
- Fixed AI Concierge and AI Agent leaving Yes/No fields empty when the model returned values such as Tak, yes, or 1.
- Fixed AI Concierge integration with LiteLLM:
 - responses with empty token counters were rejected,
 - inline attachments were sent incorrectly.

AI Proxy Online

2026.2.162.43.

history of changes for version 2026.2.162.43.

4. New features

- Added support for selecting an AI model in v4 endpoints for business rules (text sentiment, summary, prompt) and Process Builder (metadata, file analysis, chat threads), allowing a specific model to be requested instead of relying solely on the provider priority defined in the configuration.

5. Improvements

- Improved the stability and accuracy of AI Concierge agent sessions by switching to a more capable default model with an automatic fallback.
- Requests with an explicitly selected model are no longer automatically redirected to another provider in case of failure — only retries using the selected model are performed.

6. Bug fixes

- Fixed an issue where AI translations could return incomplete results when the provider rejected part of the request due to rate limits. Failed batches are now retried and automatically switched to another provider.
- Fixed an issue where AI-driven form filling could set choice field values based on loose, indirect associations. Values are now set only when directly supported by the source content, while explicit instructions provided in field descriptions (designer hints) are respected.
- Fixed significantly longer response times for basic AI operations (text sentiment, summary, prompt, translations, file analysis) when a fallback model with extended reasoning enabled was used.
- Fixed an exception during license verification when a Process Builder request did not contain token usage information.
- Fixed an issue where the AI process generator could leave empty phases that were not part of the application description.
- Fixed the ordering of steps in generated workflows so that negative end steps are placed after positive ones on the diagram.

AI Proxy Online

2026.2.135.35.

history of changes for version 2026.2.135.35.

1. New features

- Added a configurable timeout for each AI provider connection, with automatic fallback to the next available model when a request times out.
- Added support for expiration dates for Gemini 2.5 models in the AI provider configuration.

2. Improvements

- Improved the accuracy of the AI Designer when extracting data model from fields and data sources from attached process definitions.

3. Bug fixes

- Fixed an issue where AI-generated workflow paths were sometimes named "From X to Y" instead of receiving a meaningful name when no label was provided.
- Fixed an issue where the AI Designer created duplicate start steps and phases instead of updating the existing ones when regenerating a process.
- Fixed an issue where the AI Designer sometimes generated unrelated data model or workflow instances when only one of these areas was requested.
- Fixed process save errors caused by inconsistent references between AI-generated steps, phases, paths, and data sources after identifier reassignment.
- Fixed a deserialization error caused by an invalid value in a workflow path command generated by the AI Designer.
- Fixed an error when parsing the `PickersToSet` collection.
