

# WEBCON BPS 2020.3

## history of changes for version 2020.1.3.568

### Before upgrading WEBCON BPS

- 1 Make sure that WEBCON BPS licenses are up to date. It is recommended to refresh licenses before upgrading the system to avoid any unnecessary downtime.
- 1 If the changelog contains a section titled “Changes to existing features”, please verify whether the changes will impact your implemented system in any way.

### Bug fixes

#### [Portal]

- 1 Fixed how predefined filters work (e.g. All active, All created by me) on SOLR reports. The method of storing BPS ID in the SOLR database has been changed.

#### [Modern form]

- 1 Fixed an error in Firefox when a user left a form open for longer than ten minutes. The error was due to the implementation of form performance measurements.
- 1 If an empty field was set to be required (through a rule triggered by another field's value changing), the system was immediately checking if it was empty. After the change, the validation happens after inputting a value or when using a path.
- 1 Fixed a validation error when selecting multiple values in the item list column. If several values (e.g. system users), were added to the column with the ‘multiple choice’ option set – a message appeared informing about the ability to add only one value in this field. After the

change, the field will be validated correctly.

### **[Form fields]**

- 1 Corrected displaying and saving historical data for item lists when archiving an instance. The mechanism will now take into account that when an item list history is missing records from individual historical versions, it displays the most recent change. Archived instances will now correctly display data from multiple item lists.

### **[Actions]**

- 1 Fixed the „Read data from an Excel file” action. When importing an Excel file to the item list which contained a date field, an error related to an incorrect date format has occurred. After the change, the import works correctly.
- 1 Fixed a cyclical action error which caused the validation message and the number of moved workflow instances not to get logged.

### **[Web Part]**

- 1 Fixed the filtering of results in SWE reports on the SharePoint form.
